

Buffer Tanks for Chilled Water Systems Tank Sizing

Chiller manufacturers recommend somewhere between 2-6 gallons per ton for nominal cooling in a typical system. Even higher, 6-10 gallons when temperature accuracy is critical.

1. Sizing
 - Determine the system volume required by the manufacturer
 - Remember to check with the manufacturer for their recommendations as to how many gallons they suggest per ton
 - SVR = System Volume Required
 - SVR = Total chiller tons X manufacture recommended system volume required gallon per ton

2. Calculate actual existing volume of piping and equipment Table A, below indicate gallons per linear foot of schedule 40 pipe
 - ASV = Piping volume (PV) + equipment volume (EV) gallons

3. Calculate actual Buffer Tank size required (CBTR)
 - Deduct the actual system volume (ASV) from the System Volume Required (SVR)
 - CBTR=SVR-ASV

Refer to American Wheatley AWCBT charts for standard sizes. Larger sizes are available POA.

1"	0.04	8"	2.58
1-1/2"	0.1	10"	4.09
2"	0.17	12"	5.82
2-1/2"	0.25	14"	7.02
3"	0.38	16"	9.18
4"	0.66	18"	11.67
5"	1.04	20"	14.45
6"	1.5	24"	23.5
